

QUICK GUIDE

The journey of your biopsy

From sample to report, step by step.

1

The sample is taken

Your doctor obtains a piece of the suspicious tissue: with a needle, an endoscope, or surgery, depending on your case.

2

It travels to the lab

The sample is preserved in a special solution and sent to the pathology laboratory.

3

It gets processed

It's cut into ultra-thin layers and placed on glass slides, ready to be examined under the microscope.

4

The pathologist examines it

A specialist physician analyzes the cells under the microscope and, if needed, orders additional tests, such as biomarkers.

5

The report is written

Everything the pathologist finds is documented in the pathology report.

6

Your team explains the results to you

The report reaches your oncologist, who reviews it with you and defines the next steps.

How long does it take?

The full process can take anywhere from a few days to a couple of weeks, depending on how complex your sample is and what additional tests are needed.
